

AWS Essentials-Project 1

Step 1 : First step is to choose an image for the instance (i.e Windows image)

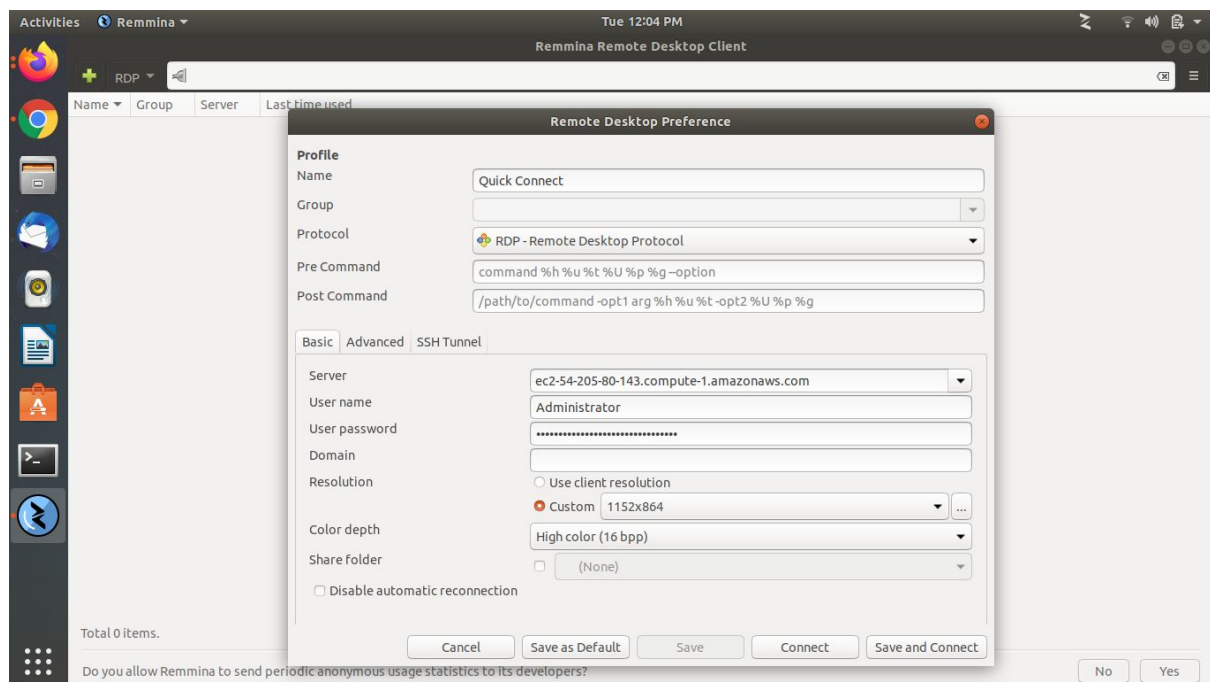

Step 2 : Then follow all the steps and configure the instance according the requirements and at the end review and launch the instance

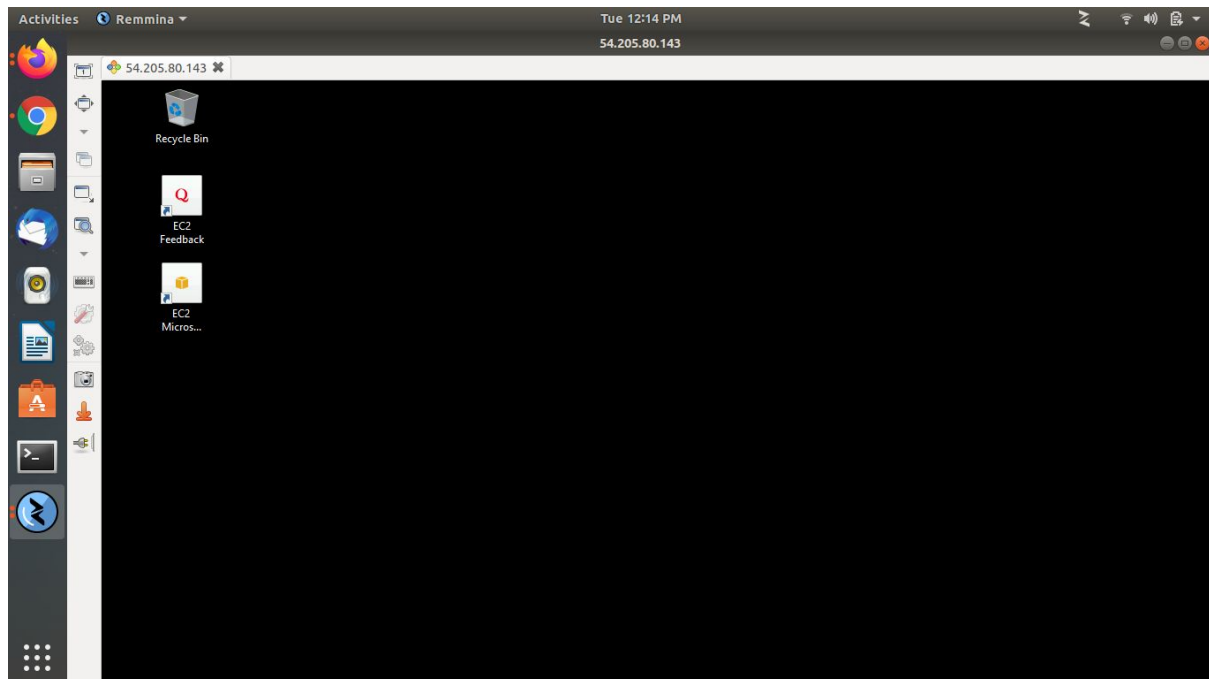

Step 3 : Since my local machine is ubuntu, I am connecting to the instance through remmina

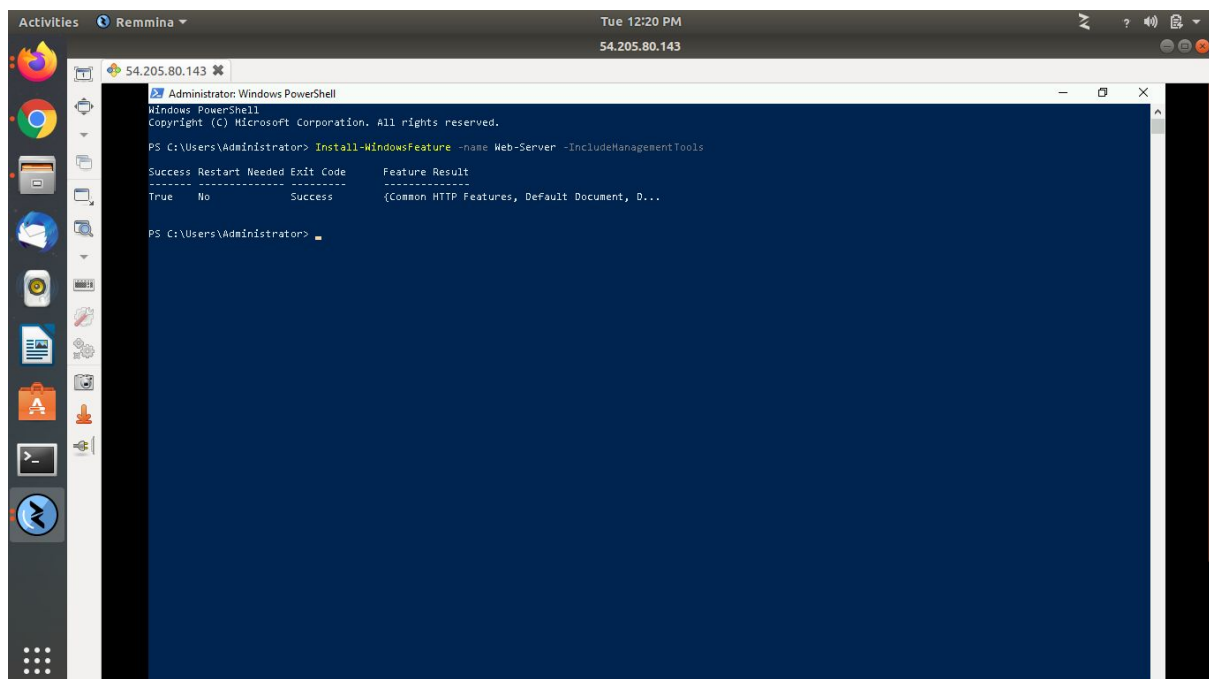

Step 4 : After connecting to the instance you will get the following screen which is similar to a windows machine

Step 5 : Then open Windows PowerShell as Administrator and run the following command:

Install-WindowsFeature – name –Web-Server –IncludeManagementTools

Step 6 : After successfully installing the server, try configuring the server by using the public ip of the instance
